The disclosure is objected to because of the following informalities: figs. 1A, 1B and 2 should be labeled as --prior art --.

Appropriate correction is required.

Claims 1-7 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

The last paragraph of claim 1 is unclear in that it specifies current is generated in accordance with the current that flows from the output of the input section active element to the input section active element.

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Susak et al. in fig. 3 discloses a transistor 24 which will inherently perform voltage to current conversion between its base and collector. It is analogous to the input section active element of claim 1 for instance. Op amp 27 may be read as the potential control circuit of claim 1 since it will set the gain of the active elements 29, 30 based on a potential at node 31 which is connected to the output terminal of transistor 24. Then transistor 30 may be read as the output section converter claimed as it too is controlled by op amp 27. However, the circuit lacks a current compensation connected to the output of transistor 24 for generating a DC current.
